

LossLogic

Explainable intelligence for bodily injury claim evaluation

Built by Mitch Salgado | 15+ years of insurance claims experience

EXPLAINABLE. TRACEABLE. AI-READY.
Structured claim evidence + deterministic business
logic + reproducible outputs

THE PROBLEM

Bodily injury claim evaluation requires adjusters to reconcile coverage, accident facts, comparative negligence, medical chronology, pre-loss conditions, causation, billing, and PIP payments. The reasoning is often spread across multiple sources and can be difficult to trace or reproduce.

WHAT I BUILT

LossLogic is an independently developed prototype that converts fictional claim evidence into structured decision support. It evaluates coverage, liability, medical causation, billing/PIP, and causation-supported medical damages while preserving the evidence behind each conclusion.

HOW LOSSLOGIC WORKS

1. SOURCE EVIDENCE Coverage, statements, medical records, bills, PIP data	2. DERIVED FINDINGS Coverage status, liability factors, causation classifications, reconciled charges	3. EXPLAINABLE OUTPUT Traceable conclusions, supported damages, JSON + human-readable report
---	---	--

SYNTHETIC DEMONSTRATION

APPLIES COVERAGE	80 / 20 LIABILITY	\$2,425 ALLOWABLE MEDICAL	\$2,075 CAUSATION-SUPPORTED BI	\$1,660 PIP PAID	\$415 REMAINING SPECIALS
----------------------------	-----------------------------	-------------------------------------	--	----------------------------	------------------------------------

WHY IT MATTERS

LossLogic separates **financial validity** from **medical causation**. A valid charge is not automatically treated as a bodily injury expense. This distinction helps prevent unsupported damages from being carried into the final evaluation.

PORTFOLIO CAPABILITIES

Insurance domain modeling
Python business logic
Structured JSON data
Evidence traceability
Billing + PIP reconciliation
Automated regression testing
Human + machine-readable reporting

PROOF OF BUILD

6 automated tests
Coverage, liability, causation, billing, end-to-end evaluation, and reporting.

Public GitHub repository
github.com/Mitch522/LossLogic

Potential use cases
AI-assisted claim review, QA, analytics, summaries, and adjuster decision support.

Independent portfolio project using entirely fictional and synthetic data. Not affiliated with any insurer, employer, client, or other claims technology project. Not legal, medical, or claims-handling advice.
