

ClaimIQ

Explainable intelligence for bodily injury claim evaluation

Built by Mitch Salgado

Insurance domain expert translating 15+ years of claims experience into structured data, deterministic business logic, automated testing, and AI-ready workflows.

THE PROBLEM

Bodily injury claims require adjusters to reconcile policy information, driver and witness statements, accident mechanics, prior medical history, post-loss treatment, diagnostic findings, bills, and PIP payments. The challenge is not just collecting the information. It is preserving the evidence and reasoning behind the decision.

WHAT I BUILT

ClaimIQ is a working prototype that transforms fictional claim evidence into a structured, traceable evaluation across **coverage, comparative liability, medical causation, billing/PIP reconciliation, and causation-supported medical damages**. It produces both human-readable and machine-readable outputs.

HOW CLAIMIQ WORKS

SYNTHETIC DEMONSTRATION RESULT

COVERAGE	LIABILITY	ALLOWABLE MEDICAL	CAUSATION-SUPPORTED BI	PIP PAID	REMAINING SPECIALS
✓ Applies	80 / 20	\$2,425	\$2,075	\$1,660	\$415

WHY IT MATTERS

ClaimIQ separates **financial validity** from **medical causation**. In the demo claim, a financially allowable orthopedic charge is excluded from the causation-supported BI total because the linked conditions are classified as pre-existing and degenerative.

Core principle: the system does not just produce an answer. It preserves the evidence and reasoning a claims professional needs to understand how that answer was reached.

PORTFOLIO CAPABILITIES

- Insurance domain modeling
- Structured JSON data design
- Deterministic Python business rules
- Evidence reconciliation and traceability
- Medical chronology and causation logic
- Billing and PIP reconciliation
- Automated regression testing
- AI-ready human + machine outputs

PROOF OF BUILD

6 automated tests covering coverage, liability, medical causation, billing/PIP, end-to-end evaluation, and report generation.

Public repository
github.com/Mitch522/ClaimIQ

Use cases
Claims decision support • QA workflows • AI-assisted summaries • Analytics • APIs • Adjuster review tools

ClaimIQ is an independent portfolio project built entirely with fictional and synthetic data. It is not affiliated with any insurer, employer, client, or other claims technology project.
